Mobile Access Control –
B-Net[®] mobile AC

Mobile Access Control with B-Net mobile AC

Checking and recording access authorizations - exactly where and when they are due. This is the great benefit of a mobile data recording via PDA. Integrate the mobile access control for employees and external companies with temporary access to the premises in addition to the stationary terminals into an overall safety concept for your company.

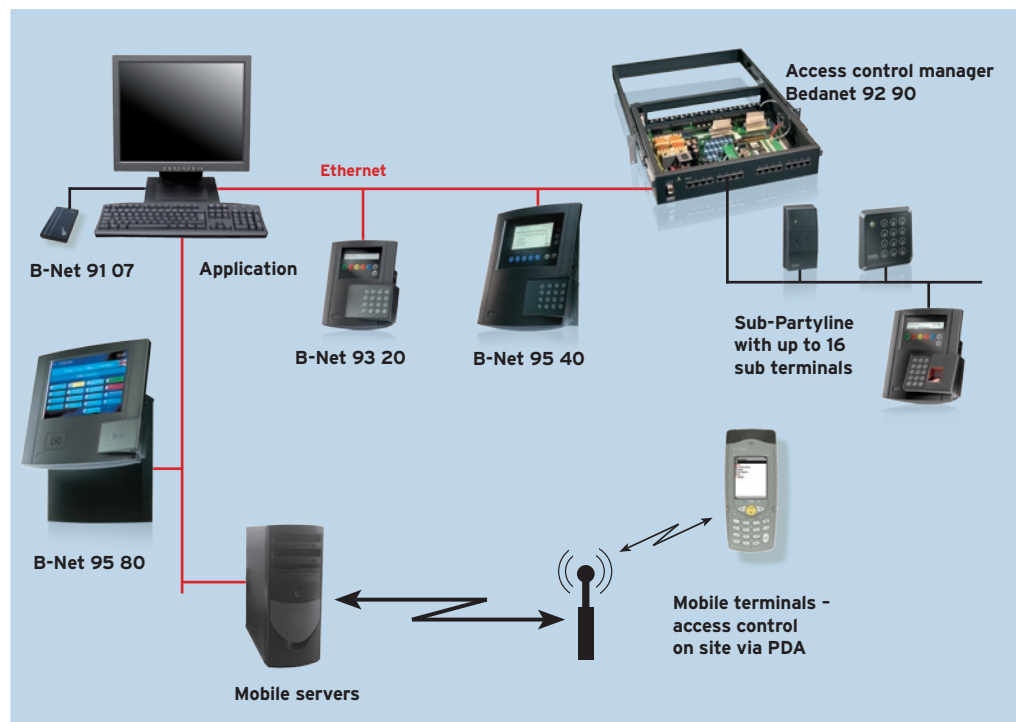

B-Net mobile AC is a solution by Kaba fulfilling all requirements of mobile access control. Due to the compatibility of the functions with our access terminals as well as the software applications of our partners, B-Net mobile AC can be integrated easily in new or existing access control systems.

A typical case of use of B-Net mobile AC would be the access control to a construction site on your premises. An employee controls the access authorizations for possible persons using a PDA and integrated LEGIC reader. In order to do this, the LEGIC badge is read, or a PIN is entered, and checked and stored on site with the saved personnel master data on the PDA.

The security guard sees the decision authorized/not authorized on the PDA display. Optionally, in/out bookings of the employees can be recorded. The collected data are transmitted from the PDA directly to the application via WLAN, GPRS, UMTS or a docking station, and updated master records are retransmitted and saved. If the network is not available, the PDA saves the access bookings offline and matches them immediately after the network connection has been reestablished.

Consequently, it can be guaranteed that the access authorizations of all possible persons valid for this day can be checked every day. A freely parameterizable registration process allows adaptation to existing access structures and individual access solutions.

The use of the B-Net mobile AC solutions provides effective benefit to your company: Realization of an overall access solution, increase of the safety transparency, up-to-date representation of all access events, and last but not least cost reduction due to flexibility.
